

ADR NETWORK

The Automated Daily Reporting Network | a service of ADR Software, LLC | 1860 Michael Faraday Drive, Reston VA 20190 | 703.230.2588 | www.softwareadr.com

Power tools for real-time labor and job safety accountability™

The **ADR Network™** provides a simple, hassle-free, highly reliable, low cost and efficient way for general contractors, owners, project managers, schedule consultants and sub-contractors to collect and access real-time manpower information at active commercial construction sites.

The ADR Network utilizes **ADR Portal Monitor™** software to monitor commercial construction site access points and populate ADR's secure, web-based databases with daily labor, safety and schedule data. Through ADR's universally accessible **ADR Web Portal™** (www.softwareadr.net), ADR Network subscribers have access to automated daily manpower and safety incident reports, in real-time, on a 24 x 7 basis throughout the life of a job. Using proprietary passive RFID technology and a uniquely numbered tag transponder on every hard hat, the ADR network monitors pedestrian traffic as it moves on and off the site and reports the activity across the network as it occurs. As a result, the ADR Network provides its subscribers anytime access, on any Internet accessible and web-enabled device (i.e. iPad or smartphone), to job specific resource and staffing information including actual man-hours logged and safety incident reports.

Where space and traffic flow permit, ADR deploys patent-pending **ADR Monitoring Portals™** to all job sites connected to the ADR Network. In situations where the portals won't fit, ADR works with the site manager to configure a more appropriate installation. When a job site is connected to the ADR Network, ADR handles all on-site installations, equipment maintenance, network monitoring, tag data processing and equipment removal so subscribers are free to concentrate on their core business, not the technology of the network. Best of all, because it's a subscription-based service there's no capital expenditure and no additional IT staff required to be an ADR Network connected job site.

The ADR Web Portal allows subscribers to set up both job schedules and user-defined schedules of values, both by sub-contractor and by job function. When matched with actual data, subscribers have the ability to track progress proactively and avoid both unnecessary overtime and costly change orders. ADR Reports are presented on-screen or by email (in both detail and summary formats) and can be displayed by site, contractor, sub-contractor, job function, resource, home zip code of each laborer and more. The real-time nature of the data, combined with the dynamic functionality of the ADR Web Portal, forces everyone associated with a project to be proactive about manpower and scheduling along the way and avoid the reactive scramble that typically occurs at job end.

Try the ADR Network on your job site: info@softwareadr.com

The screenshot shows a detailed data table with multiple columns and rows, likely representing labor or safety records. The table has a header row and several data rows.

The screenshot shows another view of the data table, possibly a different filter or report type. It includes a header and several rows of data.

The screenshot shows a form for user management, including fields for name, email, and password. There are also buttons for 'Add User' and 'Edit User'.
